

**Manufacturers of custom built
machinery for the railway industry**

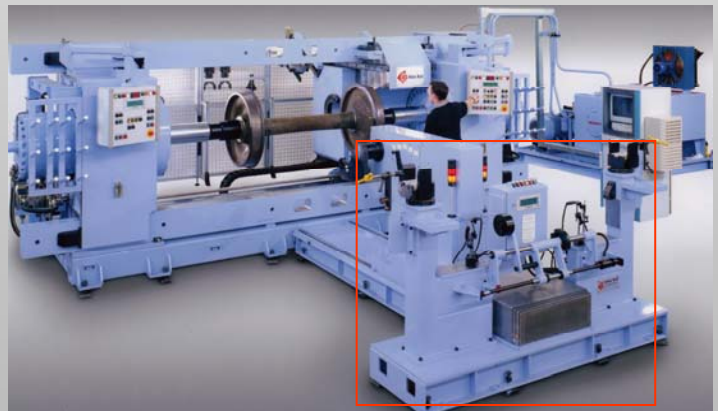

Axle Checking Stand

After fitting the wheels onto an axle in a wheel mount press, measurements need to be made to confirm the wheelset is within specification before being re-introduced to the system.

The press installation can incorporate an axle checking stand which measures the wheelset against datum's on the axle in line with a reference drawing. The axle checking stand can be seen as part of a press installation in the photograph below. As an alternative, the checking stand can be a stand-alone device

Measurements are taken by the same controller that operates the press and values are displayed on the main operator console of the press. Hardcopy reports can also be printed from this console. As an alternative, the checking stand can be a stand alone device.
